

irsend 1.0 released!

irsend is a Max-Extension to send IR-Codes from Max or Max4Live.

You need the WinLIRC-Package and a IR-(Transmitter)-Hardware.

I recommend the IR-Toy from "Dangerous Prototypes", but I think every Transmitter, that is supported by WinLIRC, will do it too.

WinLIRC has to run in background, so that irsend can use it.

The irsend-extension was not a lot of work, i just copy&paste the code of Transmit.exe in a C-Max-extension.

IR-Bulb-Remote.amxd ist a Max4Live Example-Device of an Max4Live-Instrument that play Colors of a LED-Bulb instead of Sound. The Name of your Remote-.cfg and the Code-Names have to be adapted.

Attention! since Version 0.9.1 it works fine with 32Bit versions of max and live.

Download now (Windows):

see download-section for download

irsend - Controlling all Infrared-Devices from Max or Live
